DRY-SEASON SAMPLING FOR FEDERALLY-LISTED LARGE BRANCHIOPODS AT THE CONNECTION SLOUGH AREA OF THE 2-GATES PROJECT

Introduction

Helm Biological Consulting, LLC was contracted by Mosaic Associates, LLC to conduct dry-season sampling for large branchiopods (fairy shrimp, tadpole shrimp, and clam shrimp) that are listed as threatened or endangered under the federal Endangered Species Act (e.g., vernal pool fairy shrimp [*Branchinecta lynchi*] and vernal pool tadpole shrimp [*Lepidurus packardi*]) at the Connection Slough Area of the 2-Gates Project.

The Connection Slough Area of the 2-Gates Project is located west of McDonald Island, north of Mildred Island, and southeast of Connection Slough, San Joaquin County, California. Additionally, the Connection Slough Study Area is located in an unsectionalized portion off the Bouldin Island U.S. Geological Survey 7.5 Minute Topographical Quadrangle Map (center coordinates in North American Datum 1983 Universal Transverse Mercator Zone 10 North: Easting 596109.7 and Northing 4252148.6) (Figure 1).

The 2-Gate Project consists of a fish protection plan intended to reduce the take of Delta smelt and other listed fish species, in compliance with the federal and state Endangered Species Acts. Entrainment of Delta smelt at the State Water Project (SWP) and Central Valley Project (CVP) export pumps would be reduced by the installation and operation of two operable gates in the central Delta. The project would also increase the certainty of water supply, and improve water quality. The 2-Gate Project is a five-year pilot project that is fully removable once installed.

Two gates would be installed in two separate locations, one on Old River and the other on Connection Slough. A wetland delineation has been conducted by Mosaic Associates,

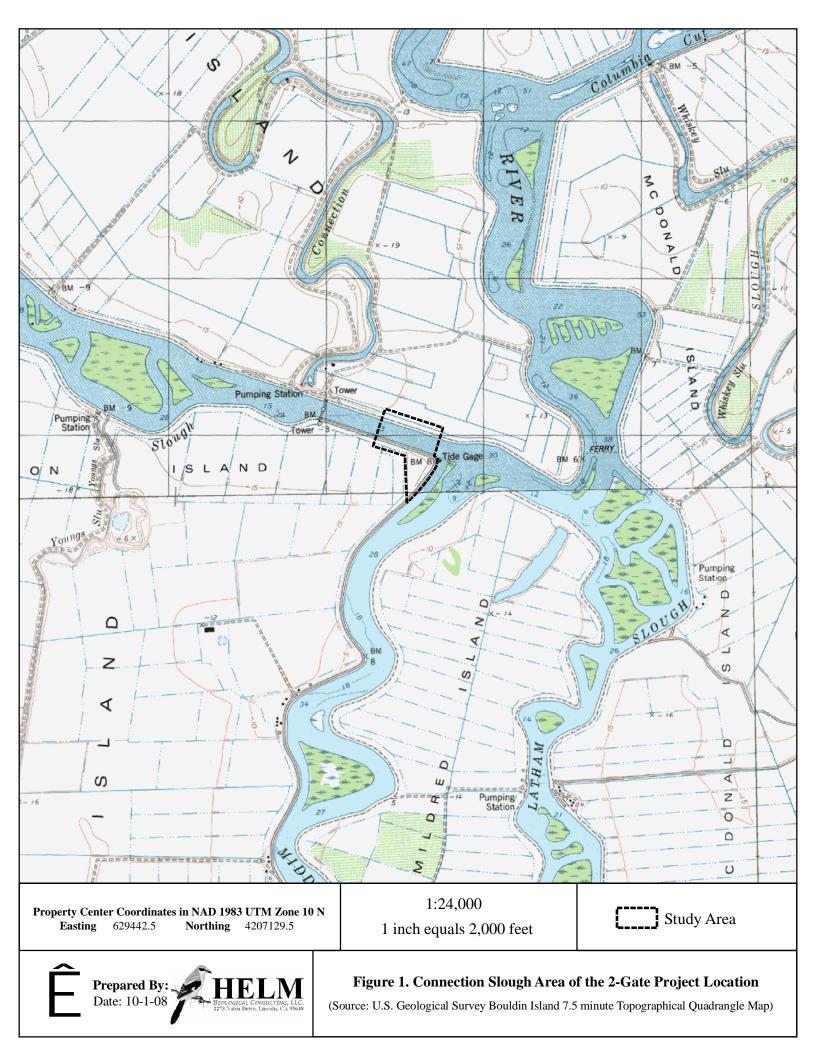

Ph: (916) 543-7397

LLC, and a single 0.5 acre seasonal wetland feature within the Connection Slough Area was assessed as potential to support the vernal pool fairy shrimp and vernal pool tadpole shrimp.

This report discusses the methods and results of the dry-season sampling for the presence of federally-listed large branchiopod at the Connection Slough Area of the 2-Gates Project.

Ph: (916) 543-7397

METHODS

Mr. Todd Wood conducted dry-season sampling on October 29, 2008 as authorized by the U.S. Fish and Wildlife Service (USFWS) (Appendix A). Sampling was conducted under permit TE-795930-5 of Section 10(a)(1)(A) of the federal Endangered Species Act, 16 U.S.C. 1531 *et seq.*, and its implementing regulations. Methods generally followed USFWS's Interim Survey Guidelines to Permittees for Recovery Permits under Section 10(a)(1)(A) of the Endangered Species Act for the Listed Vernal Pool Branchiopods (1996) and are described below.

Dry-season sampling involved the collection of 20 sub-samples of soil, mainly from the lowest topographic areas within the basin considered potential habitat for federally-listed large branchiopods by Mosaic and Associates, LLC. Soil samples were placed in liter size plastic freezer bags and marked with the project name, basin number, and date. The soil was then transported to Helm Biological Consulting's, LLC laboratory for processing and analysis.

In the laboratory, a brine solution was prepared by mixing table salt (NaCl) with lukewarm tap water in a large container. The collected soil material was placed in the brine solution. The soil material was then gently worked by hand to breakdown any persistent soil structure. The organic material rising to the top of the brine solution was skimmed off and placed in a 710-micron diameter pore-size sieve stacked atop a 75-micron diameter pore-size sieve. The soil material was processed through the top sieve by flushing it with lukewarm tap water while gently rubbing it with a soft-bristle brush. The soil retained from the 75-micron diameter pore size sieve was then removed and thinly (≈1.0 mm) spread into plastic petri dishes.

The contents of each petri dish were examined under a 10 to 252-power zoom binocular microscope. A minimum of 0.5-hour was spent searching the contents of each petri dish for large branchiopod cysts (embryonic eggs). Helm Biological Consulting's, LLC large branchiopod cyst reference collection and scanning electron micrographs of cysts (Hill and Shepard 1998, Mura 1991, and Gilchrist 1978) were used to identify and compare any cysts observed within the soil samples.

Ph: (916) 543-7397

RESULTS

Visual examinations of the soil collected from the basin on site did not reveal any evidence of federally-listed large branchiopods (e.g., cysts or carapaces of *Lepidurus* sp.) (Exhibit A). The soils supported only evidence of insects exoskeletons (mainly ants) and flatworm cysts (microturbellaria).

Representative photographs of the basins on site are in Appendix B.

Subject: Authorization to conduct wet and dry season VPb surveys at Connection Slough in San Joaquin County

Date: Thu, 16 Oct 2008 2:40 pm

By this electronic mail message and in response to your recent request (October 1, 2008, fax), Mr. Brent Helm (TE-795930-5) is authorized to conduct:

Dry-season survey and follow-up wet season survey of vernal pool branchiopods (including Branchinecta spp.) per the conditions of his Recover Permit, under the Endangered Species Act and the Interim Survey Guidelines to Permitees for Recovery Permits under Section 10(a)(1)(A) of the Endangered Species Act for the Listed Vernal Pool Branchiopods (USFWS; April 19, 1996) at the Connection Slough area of the 2-Gate Project in San Joaquin County.

Please remember to have all biologists carry a copy of their permit while doing the work, and to follow the terms and conditions of the permit and the survey protocol, including the reporting requirements. In your report, please include which surveys were authorized, the names of all persons involved the surveys, their recovery permit numbers, and the date of this authorization, to help ensure that we correctly record the fulfillment of the reporting requirement under this authorization. Please let us know if the surveys are not performed as authorized, or if they are done by a different permittee under a separate authorization.

Please keep in mind that the Service can authorize surveys that establish presence, but not surveys where the purpose is to determine absence when there is a reason to believe that the species can be present even when they are not detected. Such reasons would include species characteristics that make it hard to detect, habitat suitability, and proximity to known occurrences of the species. Therefore, if additional information becomes available to us that indicate that listed crustaceans are likely to be present at the project site, the Service may determine that the species are present even if your surveys have failed to detect individuals or cysts. Please keep in mind; all soil samples collected for dry-season sampling must be collected during the dry season. The dry season is defined generally as that time between April 15th and until the first qualifying rain event on or before October 15th, defined as a frontal precipitation of more than one half of an inch for 24 hours.

Please send separate copies of the report(s) to the San Joaquin Valley Branch (Attn. Mary Hammer) and David Kelly (of this office) at the time of any formal or informal consultation under section 7 of the Endangered Species Act with the Fish and Wildlife Service.

Please reference track number 84120-2009-TA-0051 in future correspondence concerning this sampling. Thank you.

RE: RESULTS OF THE 2008/2009 WET-SEASON SAMPLING FOR FEDERALLY-LISTED LARGE BRANCHIOPODS AT THE CONNECTION SLOUGH AREA OF THE 2-GATES PROJECT.

Dear Mr. Kelly:

Wet-season sampling was conducted at the Connection Slough Area of the 2-Gates Project during the 2008/2009 wet-season (Figure 1). Sampling was conducted by Dr. Brent Helm and Mr. Todd Wood under permit TE-795930-5 of Section 10(a)(1)(A) of the federal Endangered Species Act, 16 U.S.C. 1531 *et seq.*, and its implementing regulations. Site visits were conducted on November 14, 2008; December 24, 2008; January 8 and 30, 2009; February 18, 2009; and March 5, 2009 after all major storm events of the 2008/2009 wet-season. The site supports one ½ acre basin on the south side of Connection Slough which never had ponded water during any of the wet-season visits (Exhibit A). Similar results were obtained from dry-season sampling conducted by Helm Biological Consulting, LLC in 2008 (only ant exoskeletons and microturbellaria cysts were observed), indicating a more xeric environment. In conclusion, the basin on site is not considered potential habitat for federally-listed large branchiopods based on our observations during the 2008/2009 wet-season and the results of 2008 dry-season sampling.

This letter constitutes our 90-day report, as per our section 10(a)(1)(A) permit requirements, for wet-season sampling efforts at the Connection Slough Area of the 2-Gates Project.

If you need additional information, please call us at (916) 543-7397. Thank you for your time and consideration in this matter.

Sincerely,

Brent Helm, Ph.D. Senior Ecologist

But Tolehan

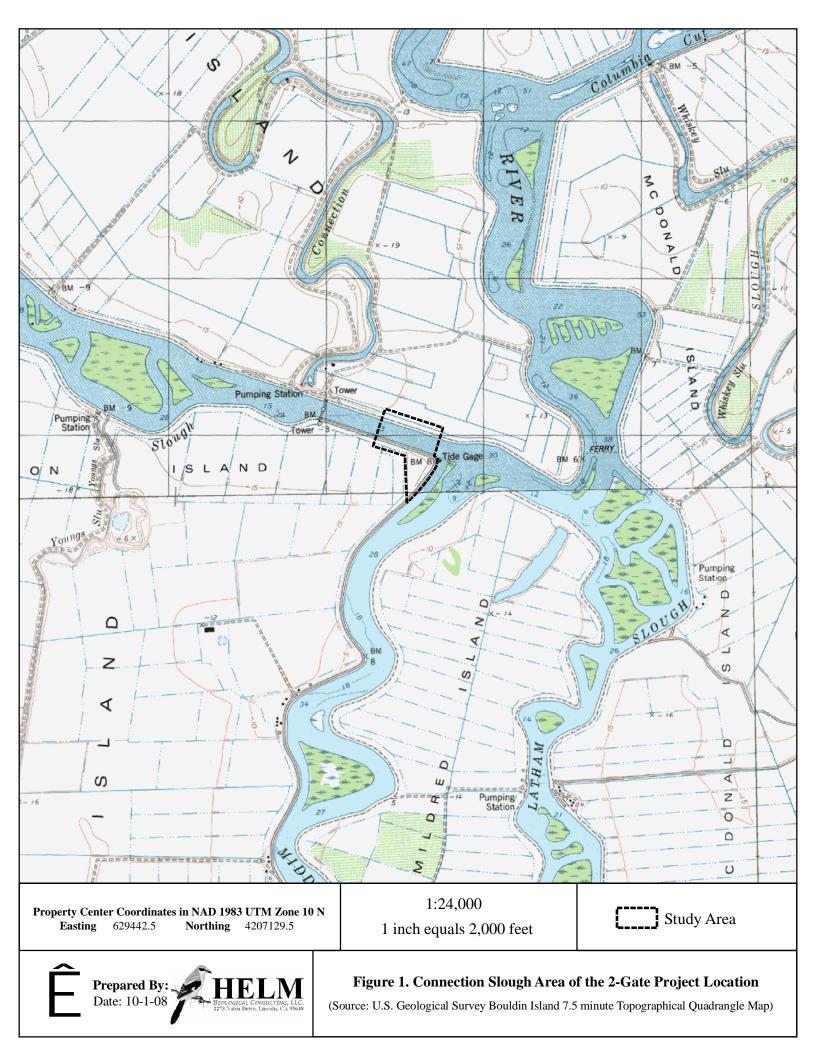

and

Todd Wood

Wetland Ecologist

Supplemental Information on Wet-Season Surveys for Large Branchiopods Provided by Brent Helm, Ph.D., Helm Biological Consulting, Inc., August 5, 2009

According to U.C Davis Statewide Integrated Pest Management Program daily weather report for Tracy, California, a total of 6.81 inches of precipitation fell during the months of November 1, 2008 through March 31, 2009. A summary of the rainfall per site visit is provided below.

- Our first site visit was conducted on November 14, 2008. A total of 0.51 inch of rainfall had occurred during that month prior to sampling.
- Our second sit visit was conducted on December 24, 2008 after a several back-toback storm events generated 0.76 inch of rainfall. To date 1.65 inches of precipitation had occurred.
- Site visit number three was conducted on January 8, 2009. Between this survey date and the prior survey date only 0.47 inch of rain had occurred. At this date 2.12 inches of rain had been recorded.
- The fourth survey date occurred on January 30, 2009 five days after a fairly large storm event occurred that resulted in 1.77 inches of precipitation. Combined rainfall recorded to date was 3.89 inches.
- Our fifth site visit occurred, on February 18, 2009, one day after 14 days of back to-back storm events accumulated 2.25 inches of rain. A total of 6.14 inches of rain had been recorded to date.
- Our last site visit occurred on March 5, 2009 one day after a storm event produced 0.44 inch of rain. To date 6.64 inches of precipitation had occurred.

No ponding or soil saturation was observed within the basin during any of the site visits conducted during the wet-season. The basin on site was delineated as a seasonal wetland by Mosaic Associates. Many seasonal wetlands derive there hydrology from high ground water tables or precipitation that saturates the soil, but may never actually pond water. The far majority of habitats that support or potentially could support federally-listed large branchiopods would pond for short durations, after 4 inches of rainfall was received during the winter months (when evaporation and transpiration are at a minimum). Perhaps the seasonal wetland on site never ponds water, or very irregularly pond water during above annual rainfall years, and instead that plants are supported by a high ground water table that is known to occur in the delta.

Given the following:

1. No evidence of federally-listed large branchiopods, nor other crustaceans were observed in the basin during dry-season sampling.

- 2. No ponding nor soil saturation was observed during the wet-season.
- 3. The historic habitats on site (i.e., tidal tule marsh) and current habitats on site-(i.e., agricultural crops consisting of sun flowers, corn, etc.) are not known to support large branchiopods.

The conclusion is that the basin does not offer habitat for aquatic species, especially those species that are dependent on a minimum of 1 to 2 inches of ponding depth at a duration of two or more weeks, such as the vernal pool fairy shrimp (*Branchinecta lynchi*).

Measurement details about TRACY.A variables:

Air temperature: Daily max/min measured at 1.5 m (4.92 ft). Precipitation: Daily total measured in a 20 cm (8 in) diameter gauge. Soil temperature: Daily max/min measured at a 15 cm (6 in) depth. Humidity: Daily max/min relative humidity measured at 1.5 m (4.92 ft). Evapotranspiration: Calculated from CIMIS hourly values.

Solar radiation: Daily global radiation measured by Licor pyranometer at 2 m (6.5 ft).

Wind speed & direction: Daily average measured at 2 m (6.5 ft).
