

Rescaling Central Valley Rivers: Reconciling Theory with Practice

Rocko Brown, PhD

Protecting, Connecting, and Re-imagining Floodplain Habitat: Strategies
for Restoring the Benefits of Floodplains to Juvenile Salmon

35th Annual Salmonid Restoration Conference

April 01, 2017

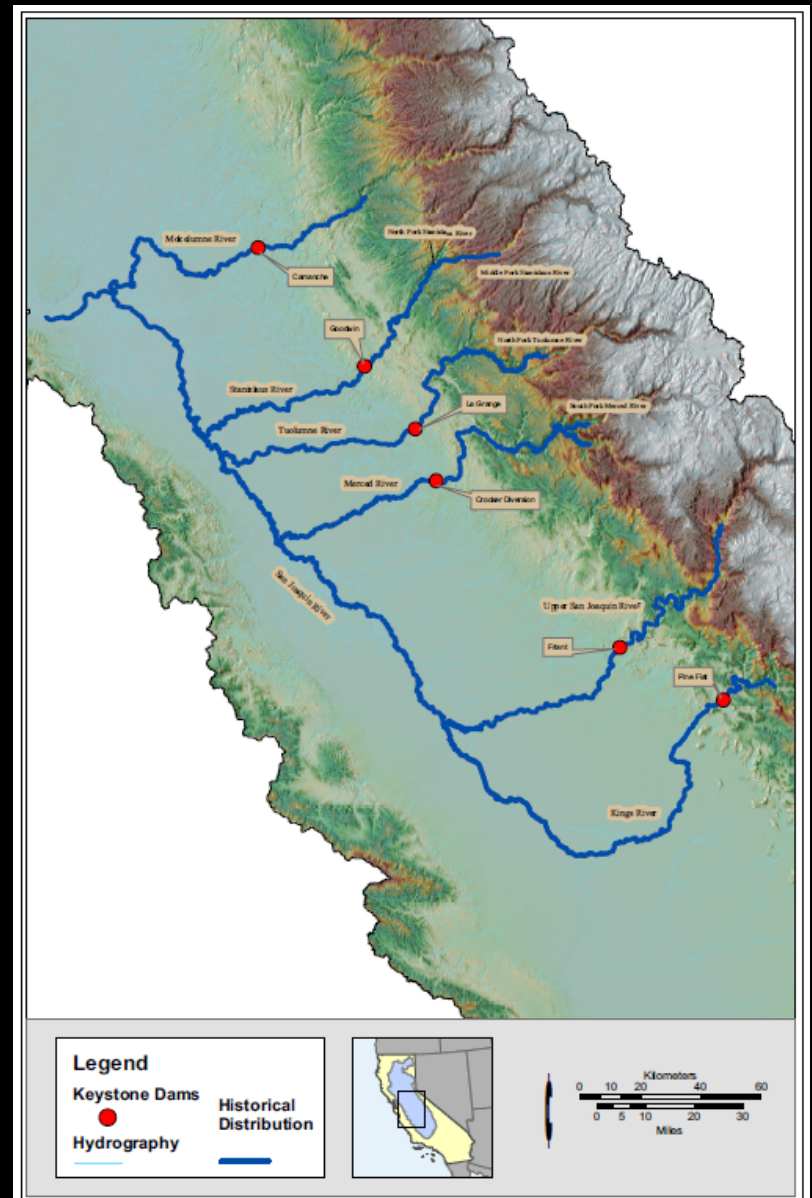

Welcome to the Anthropocene

Geology's new age

Dams are now part of the DNA of our Central Valley Rivers

Historical and current mainstem habitat in southern Central valley. NOAA, 2005

Morphogenesis of flow and form

2100

Rescaling means reshaping channels and floodplains

How much should we
prescribe through
moving dirt and rocks
versus letting the river
“work?”

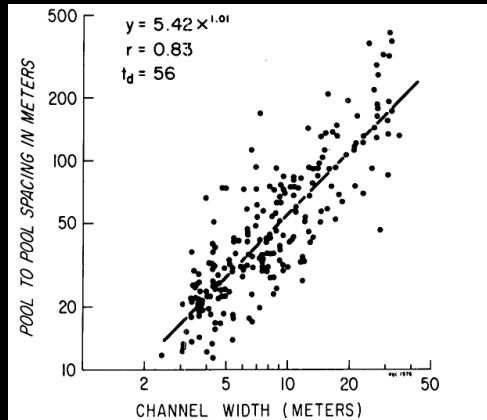

Knowing/assuming a “channel forming” flow, and some extrinsic reach properties we can calculate stuff

Dimensionless bankfull width $\sim B$, dimensionless bankfull depth $\sim H$, and down-channel bed slope S as functions of dimensionless bankfull discharge $^Q Q$

(Parker et al., 2007. Physical basis for quasi-universal relations describing bankfull hydraulic geometry of single-thread gravel bed rivers)

Meander wavelength as a function of channel width for 438 locations (NEH 654, Ch12)

Pool spacing as a function of channel width

(Keller and Melhorn, 1978. Rhythmic spacing and origin of pools and riffles)

Ideal relationships between form, sediment, plants and fish

Rivers shapes are defined by variability

Meanders have multiple frequencies of oscillation, even altered systems

Meander spectrum for section of the
Angabunga River
(Speight, 1965. MEANDER SPECTRA
OF THE ANGABUNGA RIVER)

$$\lambda = aW$$

Typical meander wavelength
equations are monochromatic,
but real rivers are not

Rivers shapes are defined by variability

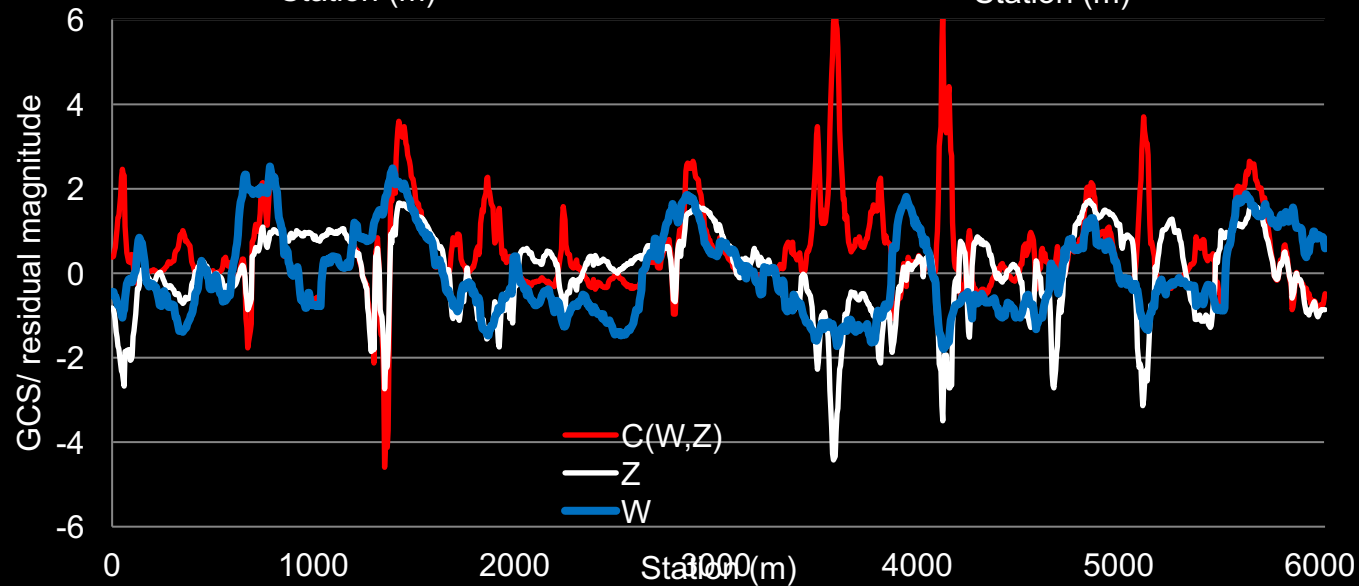

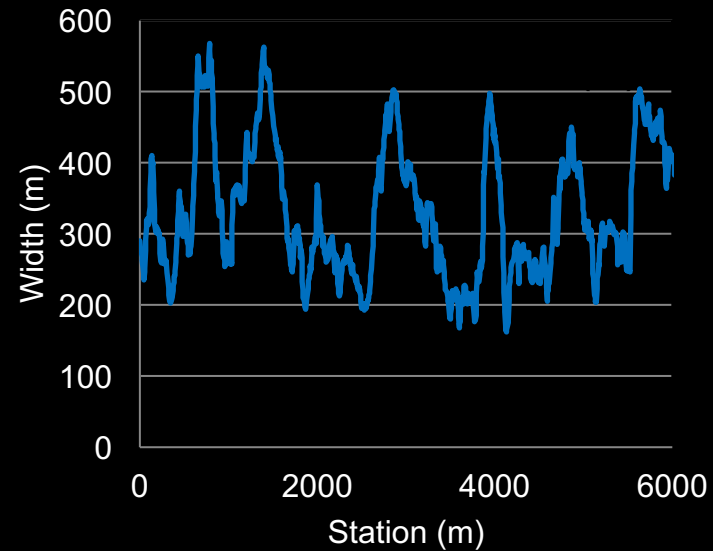

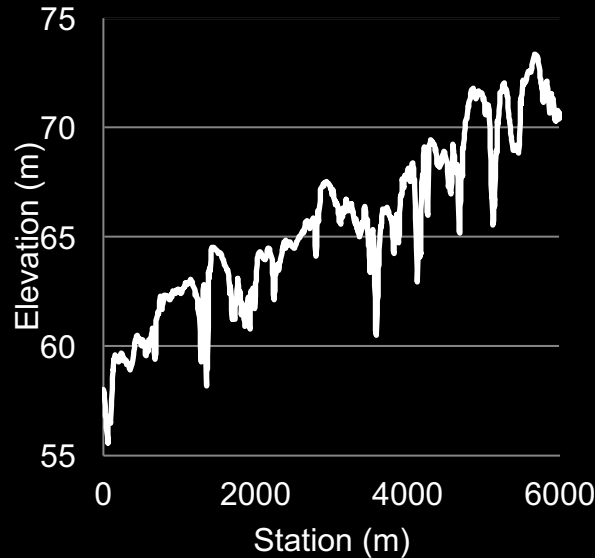

Timbuctoo Bend of
LYR,

$S = 0.002$

$Dd_{50} = 164 \text{ mm}$

$Q_{bf} = 142$

Rivers shapes are defined by variability

Autocorrelation of joint bed and width oscillations for
LYR Timbuctoo Bend

**Width and depth covary
and oscillate quasi-periodically, structured
at several scales at channel forming flows**

$$\neq W = aQ^{0.5}$$

Brown, R. A. and Pasternack, G. B.: Bed and width oscillations form coherent patterns in a partially confined, regulated gravel–cobble-bedded river adjusting to anthropogenic disturbances, *Earth Surf. Dynam.*, 5, 1-20, doi:10.5194/esurf-5-1-2017, 2017.

Channel rescaling is simple, but not for floodplains

- Space for a channel is preserved through flood control, so infilling is typical to the extent that it does not raise base flood elevations
- Several factors make it difficult to restore floodplains
 - Rivers have incised
 - Flows are reduced
 - Levees
 - Former floodplains now have other uses

How much to prescribe through design versus letting river “do it's thing”?

- Simple shapes evolve into fluvial forms with flow
- Increased stabilization of bars from vegetation growth during drought

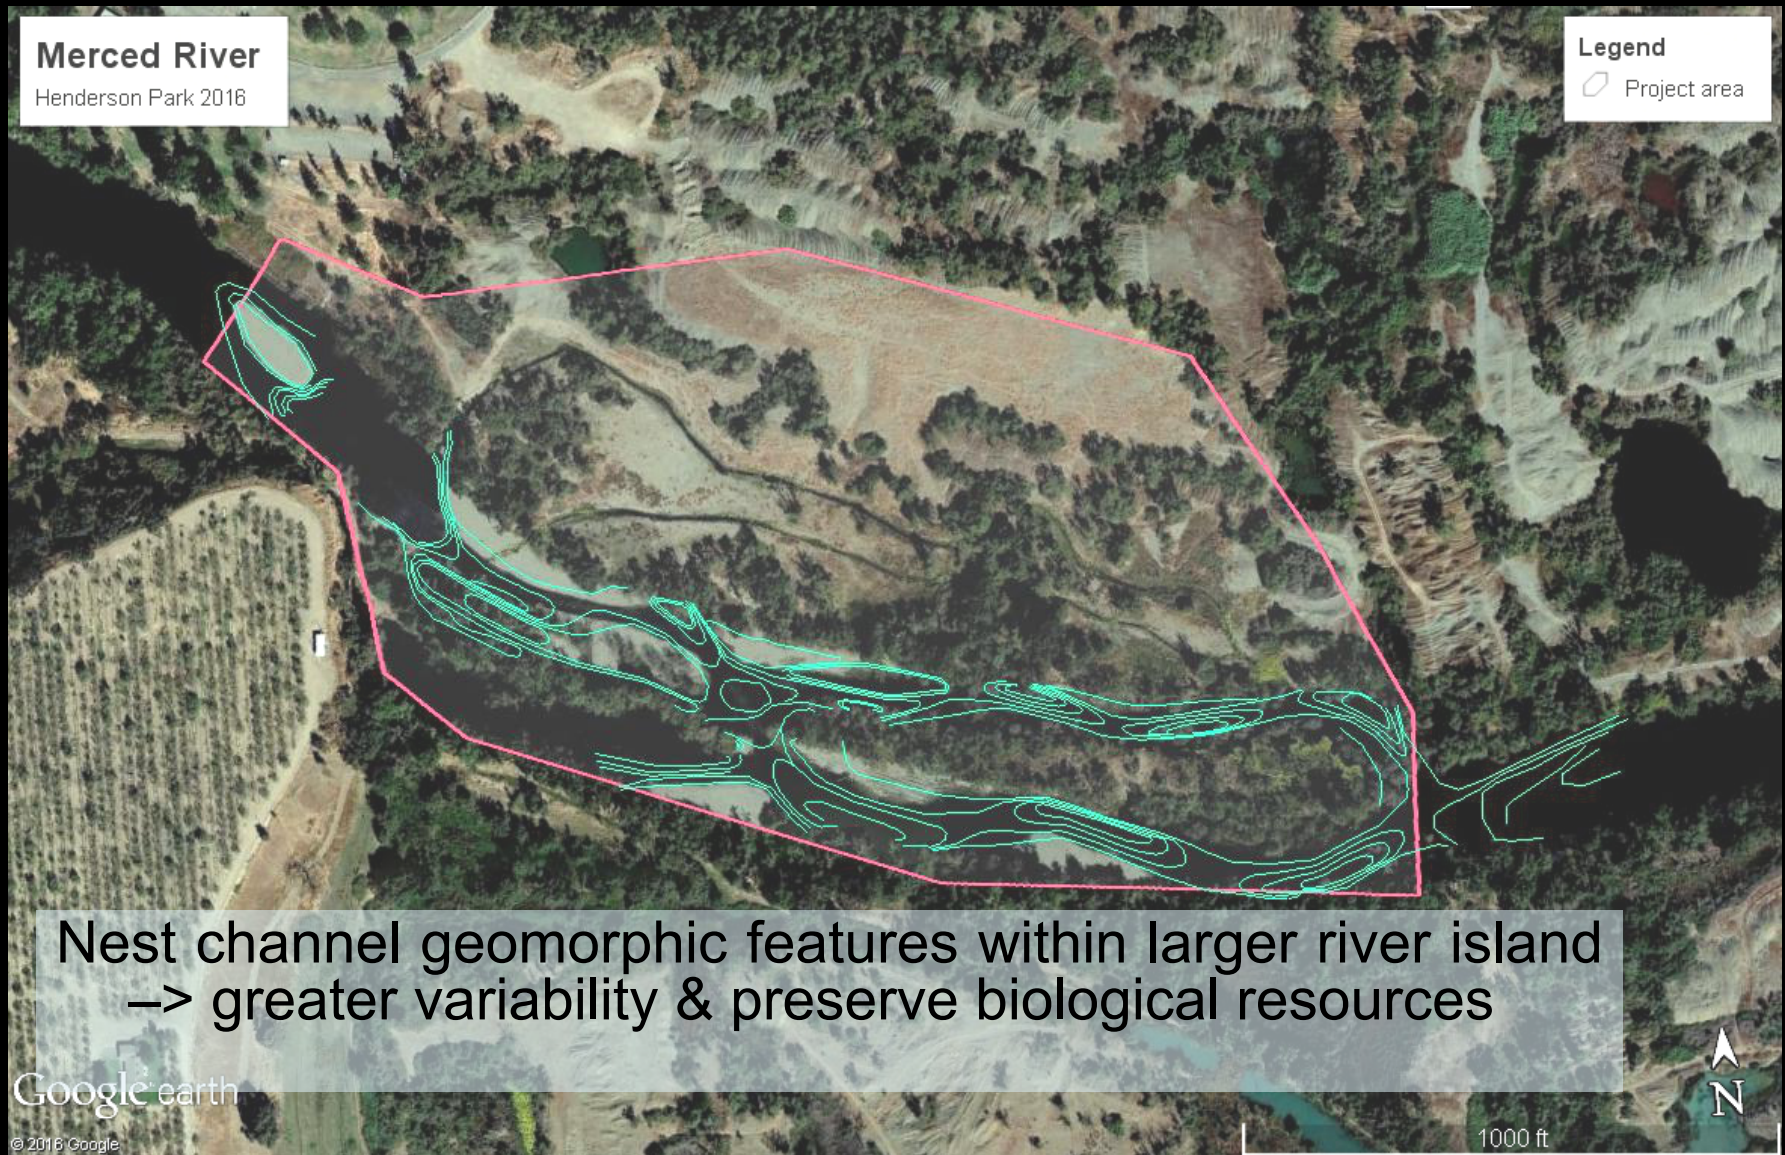

River islands as rearing habitat
